

# User manual

## Field agent application

Scanning application on Zebra handhelds, for boarding and ramp agents.

This application equips **field agents**. It is used to scan boarding passes and baggage tags at every stage of handling a flight.

The handheld scanner behaves like a keyboard: simply open the scanning screen and press the trigger. Nothing has to be typed and there is no field to tap.

Each station matches a specific moment in the process. Use the one that matches your physical position: desk, belt, X-ray, ramp or gate.

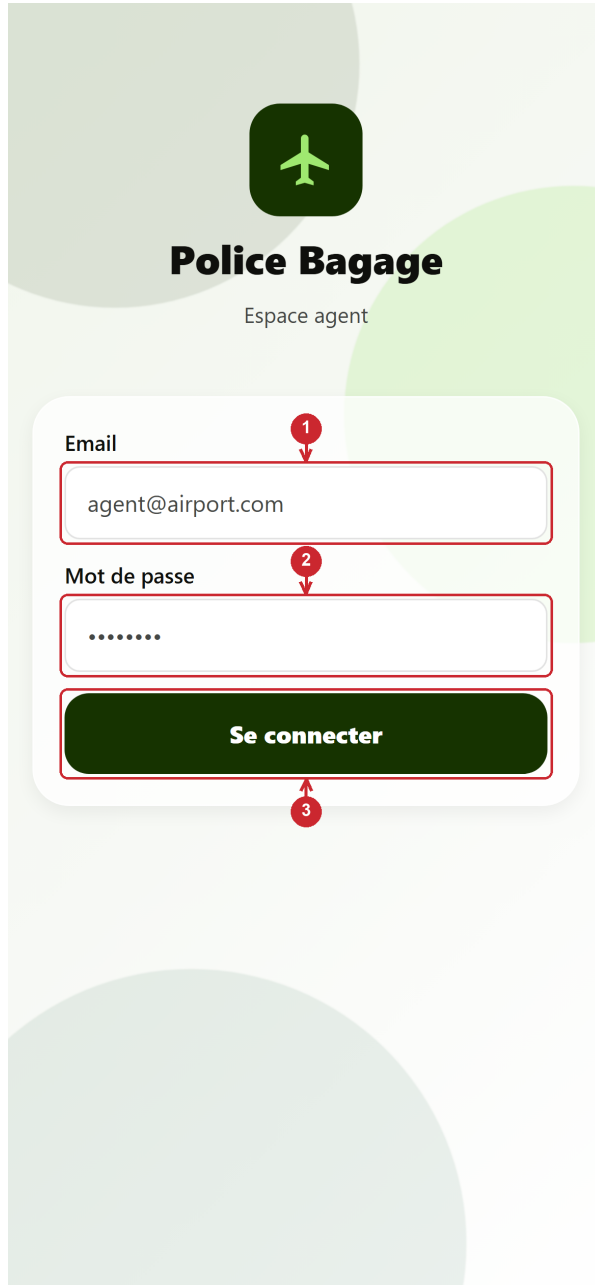

The application interface is in **French**, the working language of the field agents. Screen labels therefore appear in French exactly as agents see them on the handheld, while this manual explains them in English.

The screens in this manual are faithful reproductions of the application, rebuilt from its source code and design system. They are not photographs of a device, and the figures shown are examples.

# 1. Signing in

Your account is created by a supervisor. There is no self sign-up: if you have no credentials, ask your manager.

The session stays open between uses, so you do not have to sign in again for every flight.

The image shows a mobile application sign-in screen. At the top, there is a dark green rounded square icon with a white airplane symbol. Below the icon, the text "Police Bagage" is displayed in a bold, black font, followed by "Espace agent" in a smaller, regular black font. The main form area is a white rounded rectangle with a subtle shadow. It contains three elements: an "Email" label above a text input field containing "agent@airport.com", a "Mot de passe" label above a password input field with seven dots, and a dark green button with the white text "Se connecter". Three red circular markers with white numbers are placed to guide the user: marker 1 points to the email input field, marker 2 points to the password input field, and marker 3 points to the "Se connecter" button.

Sign-in screen.

## What each marker shows

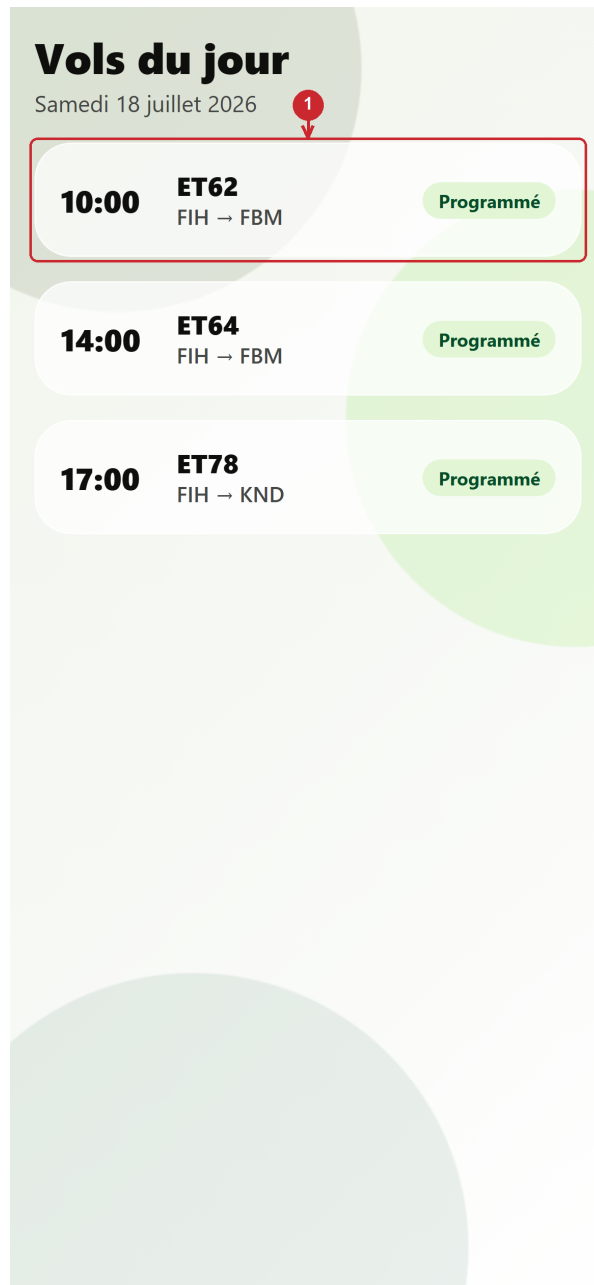

- 1. Your agent login.** The address your supervisor gave you when the account was created.
- 2. Your password.** Your personal password. If you forget it, only a supervisor can reset it.
- 3. Open the session.** Opens the session and shows the flights of the day.

If the message says the account is not active, contact your supervisor.

## 2. Choosing your flight

The application lists the flights of the day for your airport, sorted by departure time. Tap the flight you are assigned to.

Everything you scan afterwards is attached to that flight. Check the number before you start: a scan made on the wrong flight is rejected.

Flights of the day.

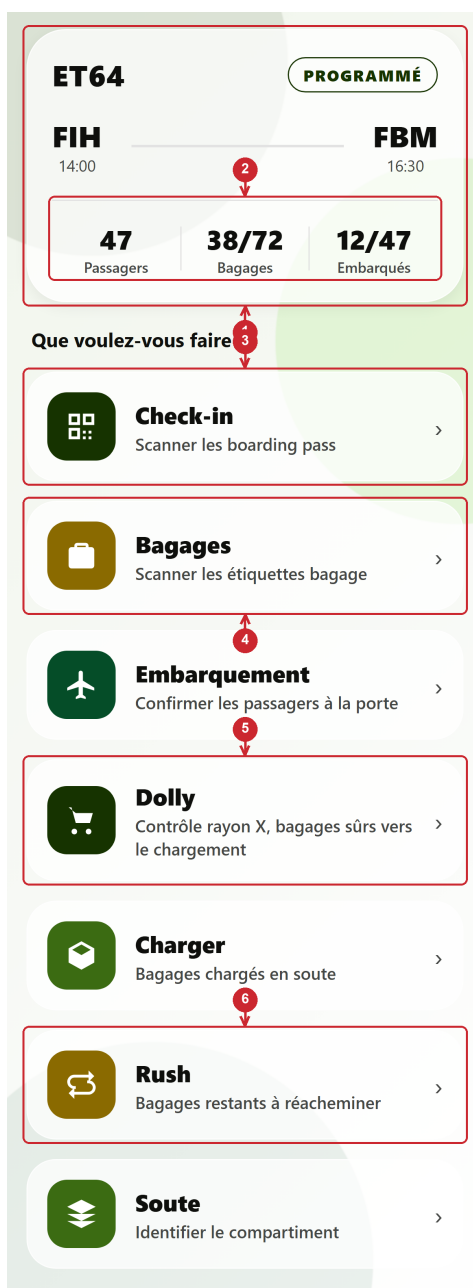

### What each marker shows

**1. Pick your flight.** One row per flight, with departure time, number and route. Tap the row to open the flight.

### 3. The work stations

Once the flight is open, the top card sums up its progress in real time. Below it, each card is a work station.

The stations follow the real order in which a bag is handled: passenger check-in, scan at the belt, X-ray screening, then loading.

Flight screen with the work stations.

#### What each marker shows

**1. Current flight.** The flight in progress, its route and times. The status shows whether boarding is open or the gate closed.

**2. Flight progress.** Progress of the flight: registered passengers, confirmed bags against the declared total, and passengers already boarded. These figures update on their own as your colleagues scan.

**3. Check-in station.** Desk station. Scanning boarding passes to register passengers and their declared bags.

**4. Baggage station.** Belt station. Scanning baggage tags. This is where the anti-fraud check applies.

**5. Dolly station.** X-ray station. Accepts only bags already registered at the belt, before towing them to the aircraft.

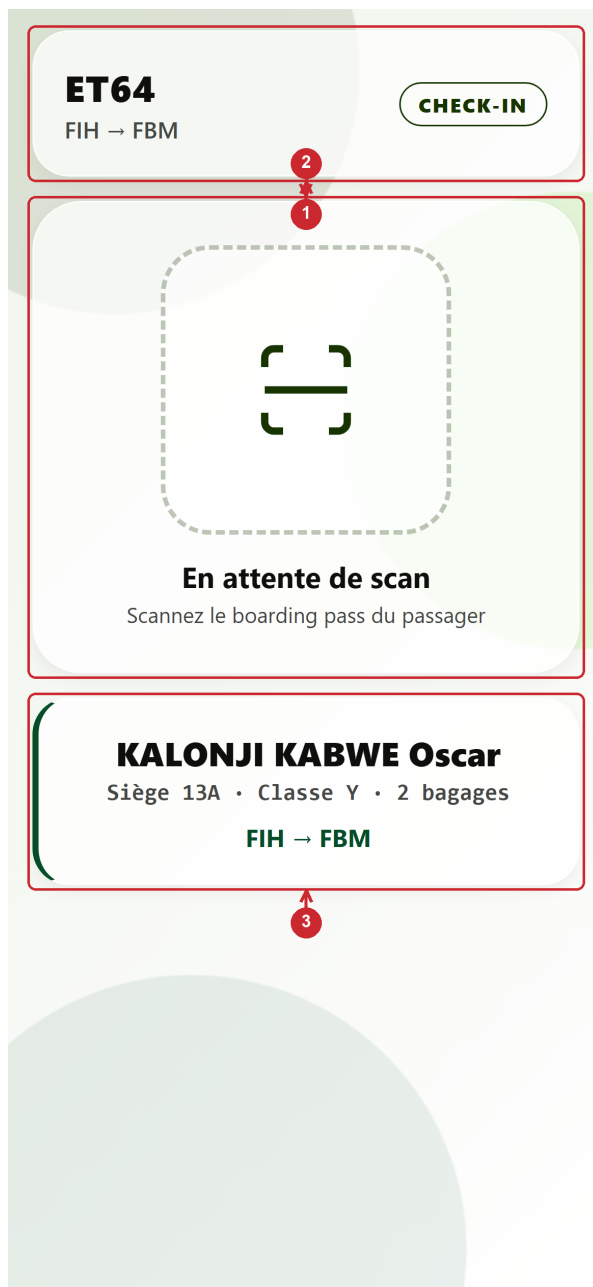

**6. Rush station.** Bags left on the ground, to be rerouted on the next flight.

The Charger and Soute stations, further down the same screen, are used for loading into the hold.

## 4. Check-in, registering passengers

Scan the boarding pass barcode. The application reads the name, seat, class and above all the **number of declared bags**.

That number is the reference for the whole anti-fraud check: at the belt, a passenger cannot put through more bags than declared here.

Check-in station.

### What each marker shows

**1. Flight and active station.** Reminder of the flight in progress and the active station. Check the flight number before scanning.

**2. Scanning area.** The scanning area. Leave this screen open and press the handheld trigger. Nothing needs tapping between two passengers.

**3. Last registered passenger.** The last registered passenger, with seat, class and number of bags. Use it to confirm to the passenger that check-in went through. If the message says the passenger is already registered, it is a double scan. Nothing is changed and you can move on to the next one.

## 5. Baggage, the anti-fraud check

Scan every tag arriving on the belt. If the bag matches a registered passenger who still has quota left, it is accepted.

Otherwise it is **rejected**, and the supervisor gets an immediate alert.

Baggage station, example of a rejection.

### What each marker shows

**1. Bags registered on this flight.** Bags already registered against the declared total for this flight. It moves up with every accepted scan.

**2. Scanning area.** The scanning area. The screen changes colour and vibrates differently depending on whether the bag is accepted or rejected, so you can work without reading every time.

**3. Rejected bag.** A rejection. The reason is spelled out. Here, a tag was issued for a passenger who declared no baggage at all.

**What to do on a rejection.** Set the bag aside, do not load it, and tell the supervisor. They already received the alert on screen and will tell you what to do with it.

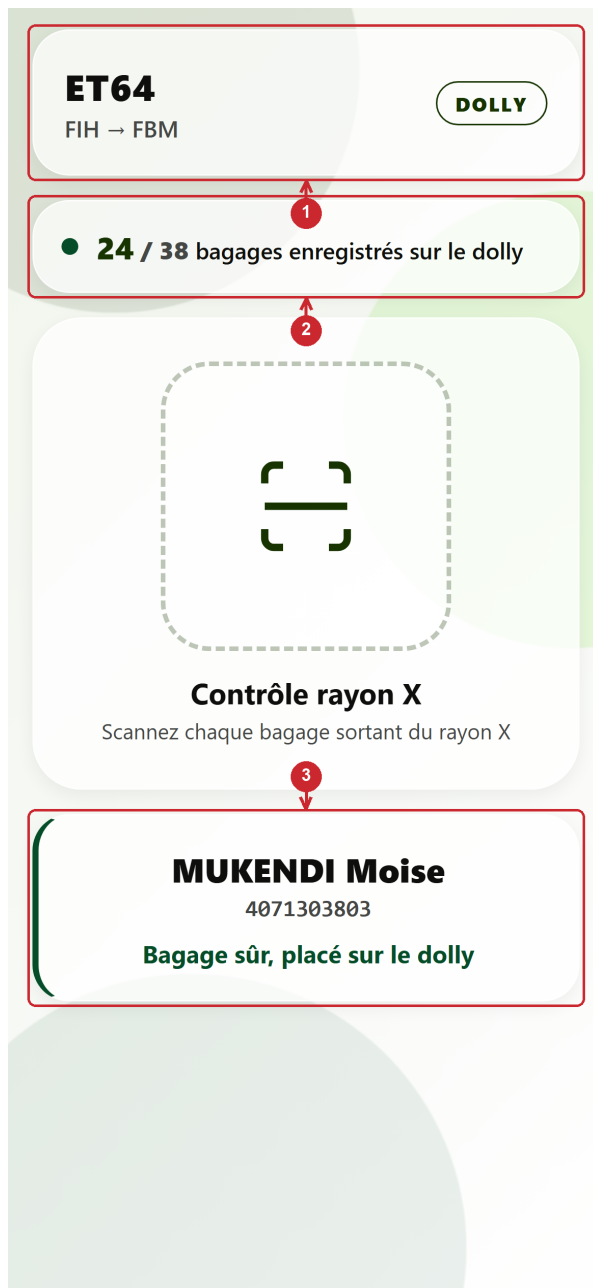

**You are not at fault.** You scan what reaches the belt. A rejection points to a tag issued at the check-in desk against a booking with no declared bag. The whole purpose of the application is to stop that parcel before the hold.

A bag already scanned that comes round again is simply flagged as a duplicate. It is not an alert.

## 6. Dolly, the X-ray checkpoint

As bags leave the X-ray, scan each one before loading it onto the dolly.

This station accepts only bags **already registered at the belt**. An unknown or never scanned bag is rejected: it must not travel to the aircraft.

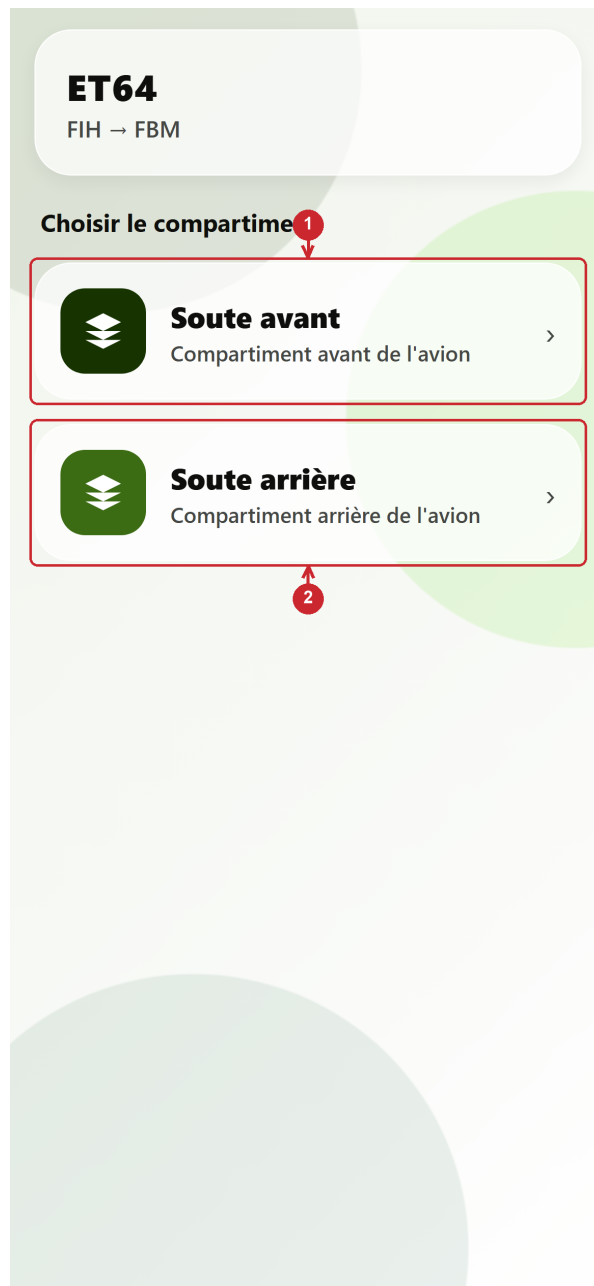

Dolly station.

### What each marker shows

- 1. Dolly station.** The Dolly station, on the flight in progress.
- 2. Dolly progress.** Progress of the dolly. The second figure is the number of bags registered on this flight: the dolly is complete when both figures meet.
- 3. Accepted bag.** An accepted bag, with the passenger name and the tag number. You can load it. Wait until the count matches before towing the dolly to the aircraft. As long as the two figures differ, registered bags are still missing.

## 7. Hold position

First choose the compartment you are loading into, then scan the bags placed there. This makes it possible to find a specific bag on arrival without emptying the whole aircraft.

Choosing the compartment.

### What each marker shows

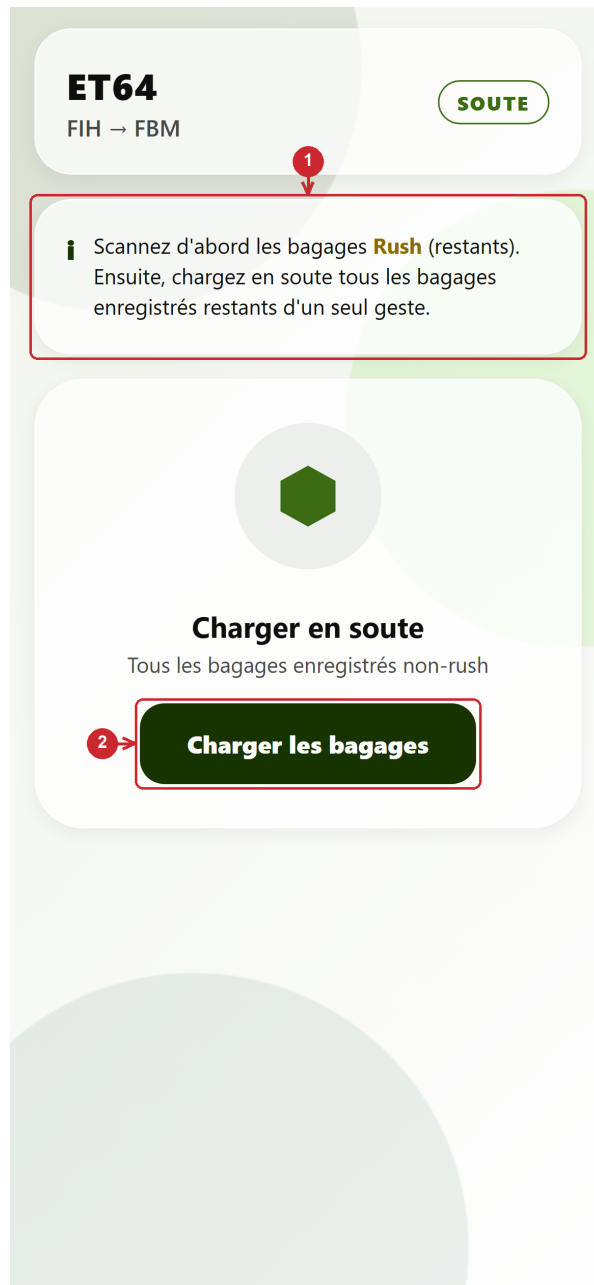

- 1. Forward hold.** Forward compartment of the aircraft.
- 2. Aft hold.** Aft compartment of the aircraft.

You can switch compartment while loading, without leaving the station.

## 8. Loading and Rush

At the end of loading, first scan the **Rush** bags, the ones staying on the ground that will travel on the next flight.

Then use **Charger** to mark every remaining registered bag as loaded in the hold, in one action. Bags marked Rush are automatically excluded.

Loading station.

### What each marker shows

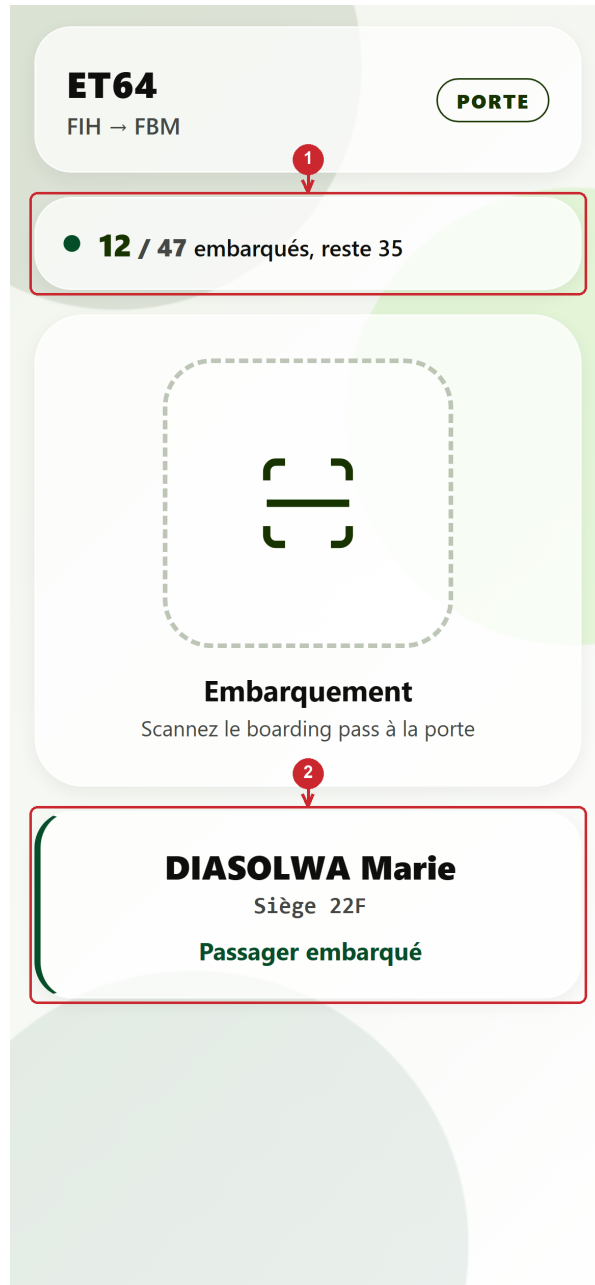

**1. Order of operations.** Reminder of the order of operations. Following it avoids loading by mistake a bag that was meant to stay on the ground.

**2. Load in one action.** Marks every registered non rush bag on the flight as loaded. The result shows how many were loaded and how many were excluded.

## 9. Boarding at the gate

Scan the boarding pass of every passenger stepping on board. The counter always shows how many passengers are left to board.

A passenger who was not registered at check-in is rejected: send them back to the desk.

Boarding station.

### What each marker shows

**1. Left to board.** Passengers already boarded against the registered total, and how many are left. This is the figure to watch before closing the gate.

**2. Boarded passenger.** The last confirmed passenger, with their seat.

A passenger scanned twice is flagged as already boarded, without being counted twice.
